# INTRODUCTION

---

## Purpose

This guide describes CSTA Interoperability.

## Document Content and Organization

This guide consists of three Chapters, Abbreviation as follows.

### **CHAPTER 1. CSTA Interoperability**

This chapter describes generals of CSTA Interoperability for SCM.

### **CHAPTER 2. ACD Server Interworking Specification**

This chapter describes details of ACD Server Interworking Specification.

### **CHAPTER 3. Samsung CSTA Phase-II PICS**

This chapter describes CSTA Phase-II PICS which SCM supports.

### **ABBREVIATION**

Describes the acronyms used in this manual.

## Conventions

The following types of paragraphs contain special information that must be carefully read and thoroughly understood. Such information may or may not be enclosed in a rectangular box, separating it from the main text, but is always preceded by an icon and/or a bold title.

### **WARNING**

Provides information or instructions that the reader should follow in order to avoid personal injury or fatality.

### **CAUTION**

Provides information or instructions that the reader should follow in order to avoid a service failure or damage to the system.

### **CHECKPOINT**

Provides the operator with checkpoints for stable system operation.

### **NOTE**

Indicates additional information as a reference.

## Console Screen Output

- The lined box with ‘Courier New’ font will be used to distinguish between the main content and console output screen text.
- ‘**Bold Courier New**’ font will indicate the value entered by the operator on the console screen.

# CHAPTER 1. CSTA Interoperability

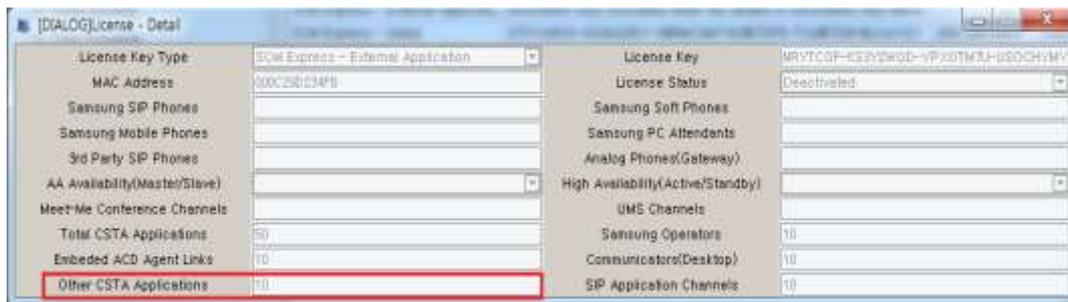

## 1.1 General Requirements

### 1.1.1 Introduction

To interwork with CSTA applications, SCM supports CSTA Phase II. For more details, please refer to CHAPTER 3 about CSTA Phase II PICS for Samsung CSTA Driver. In this chapter, general requirements are describes for CSTA interworking.

### 1.1.2 License

CSTA license defines the capability to use CSTA application. Operators should input CSTA licenses in the [SCM Administrator>CONFIGURATION>Miscellaneous>License] menu to integrate with CSTA applications such as Samsung Operator, Embedded ACD Agent, Communicator, ACD Server, SC Plus and other CSTA Applications. When an external license is issued, each CSTA application can be connected up to the number of CSTA application channels which is defined in the license. In case of ACD Server, [Other CSTA Applications] license is required. Other CSTA applications in the absence of any different declaration uses the channels specified in [Other CSTA Applications]. The number specified in [Total CSTA Applications] entry means total available number that can be assigned to CSTA applications. It is including 10 licenses that SCM basically provides for SC Plus.

1.1 CSTA License

In SCME V5, new license framework is introduced. Old CSTA license can be used or new Activation Key can be issued for CSTA. Activation Key is set in the [SCM Administrator>CONFIGURATION>Miscellaneous>Activation Key] menu.

Figure 1.2 CSTA Activation Key

### 1.1.3 CSTA Configuration

As a client, CSTA application makes TCP connection to SCM with SCM IP address and CSTA port.

Each User Group has separate connection with a different CSTA port, which is determined according to the User Group. Therefore, ACD Group/Agent/IVR is controlled depending on the User Group. CSTA port for each user group is shown in the [SCM Administrator>

CONFIGURATION>User Group>Change User Group>Options] menu.

When several SCM is installed in a site, unique CSTA Call Id is available by setting CSTA Node Code in the [SCM Administrator>CONFIGURATION>User Group>Change User Group>Options] menu. Each SCM should have different CSTA Node Code. If just one SCM is installed in a site, CSTA Node Code has no meaning.

Figure 1.3 CSTA Configuration

## 1.1.4 SCM Specific Features

### CSTA Connection ID Length

Generally CSTA Connection ID is 4 byte, whereas SCM uses 6 byte for CSTA Connection ID. If a CSTA application supports 4 byte Connection ID only, upper 4 byte of 6 byte CSTA Connection ID can be used. Lower 2 byte is always set to 0x00, 0x00.

### OCTET STRING

SCM CSTA Driver is developed based on CSTA Emulator by Unigone Inc. SCM uses OCTET STRING as a hex value (4 bits) to express some integer. '1234' defined in OCTET STRING can be showed [12 34] in hexadecimal.

Only 4-digit Agent ID and Password is permitted in SCM.

There is an exceptional usage of OCTET STRING. Exceptionally, Agent ID defined in OCTET STRING in Agent Logged Off message is expressed with IA5String format.

Refer to a following example.

Example) Device ID: 1000 Agent ID: 2000 Password: 1234 Agent Group: 222

Agent Login:

```
a1 21 02 02 04 fb 02 01 0f 30 18 80 04 31 30 30 30 a3 10 a0 0e 8a 02
20 00 8b 02 12 23 80 04 32 32 32 32
```

Agent Logout:

```
a1 23 02 02 04 fd 02 01 0f 30 1a 80 04 31 30 30 30 a3 12 a1 10 8a 04
32 30 30 30 8b 02 12 34 80 04 32 32 32 32
```

## 1.1.5 Limitations

### Active-Standby Configuration

When two SCMs are configured as an Active-Standby system, an active SCM and a standby SCM share a component IP address. A CSTA application connects to the

currently active SCM with the component IP address.

If a standby SCM switches over to an active system, a CSTA application has to re-connect to newly active SCM and has to follow the ACD Server interworking flow described in Part 1.2 again if necessary.

Connected calls are guaranteed under switch-over and can be controlled by CSTA if it is preceded by Monitor Start requests after re-connecting.

Newly connected calls after switch-over can be controlled by CSTA.

### **Active-Active Configuration**

When SCMs are configured as an Active-Active node, CSTA application can connect one of Master Node and Slave Node to control users by CSTA. But the CSTA control to some groups which are belonged to a particular node such as ACD group is not supported from the other node.

## 1.2 ACD Server Interworking Specification

### 1.2.1 Introduction

Among CSTA application, ACD Server wants to monitor users as well as to control Automatic Call Distribution (ACD) instead SCM. In this case, additional procedure is required as follows.

### 1.2.2 ACD Control Mode

To control ACD, the CSTA application has to interwork as an ACD Server. SCM provides ACD Server interworking specification.

The ACD Server can change ACD control mode by the procedure defined in the ACD Server Interworking specification.

- System Auto: ACD is controlled by SCM.
- CTI Server: ACD is controlled by ACD Server.

Default ACD control mode is System Auto mode. ACD Server can change the mode to CTI Server mode as described above. Even if the current ACD control mode is CTI Server mode, SCM resets the mode to System Auto if all connections between ACD Server and SCM are cleared.

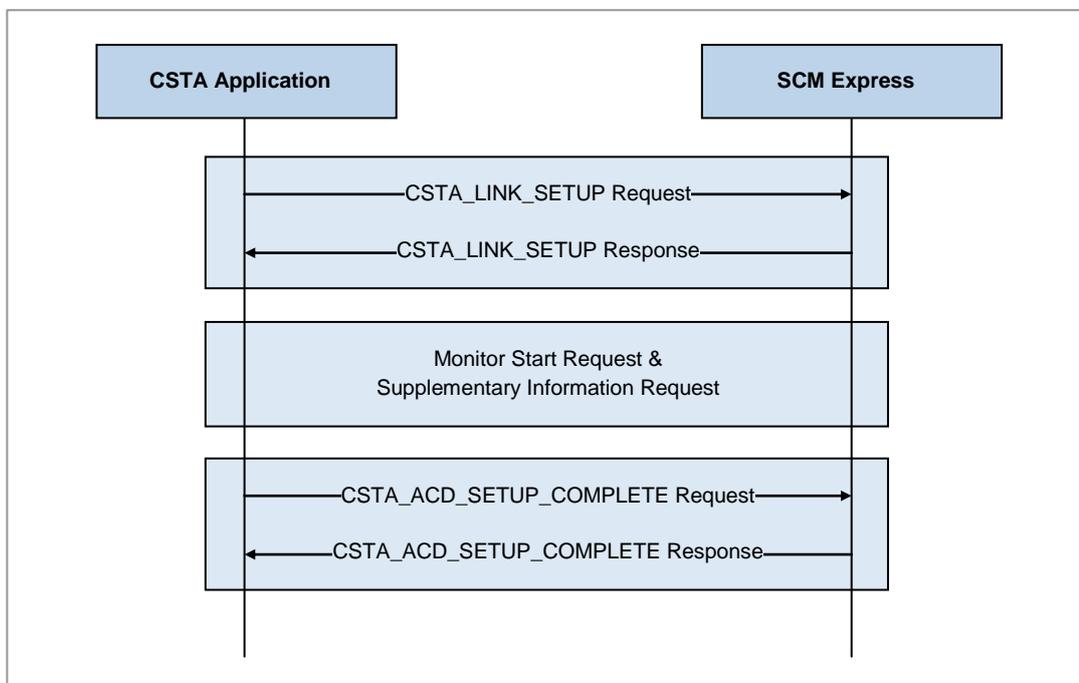

Figure 1.4 Message flow between CTI application and the SCM

### 1.2.3 CSTA Link Management

Normally, SCM does not manage whether CSTA connection is alive or not but SCM checks link alive for some special CSTA applications such as Samsung solutions and ACD Server. These applications follow additional procedures defined for SCM. The CSTA application connected to SCM as an ACD Server has to send CSTA\_ESC\_LINK\_ALIVE to SCM periodically. SCM checks the receive time every 5 seconds. SCM destroys the CSTA connection when the time is past more than 30 seconds from the receive time.

SCM supports several CSTA connections. Even though a CSTA link which mode is a CTI Server mode is destroyed, the ACD control mode is not changed if other links under CTI Server mode are available.

# CHAPTER 2. ACD Server Interworking Specification

## 2.1 Introduction

ACD Server Interworking Specification is an additional procedure for a special purpose such as ACD server to provide more information. CSTA application establishes a logical private link to identify application type with CSTA\_LINK\_SETUP message.

By CSTA\_LINK\_ALIVE message SCM manages the private links. Other messages are used to get additional number plans.

CSTA Escape message is used for request of ACD Server Interworking Specification and the response is delivered in the CSTA Private message. Details for each message are described below.

## 2.2 Samsung Specific CSTA Messages

### 2.2.1 CSTA\_LINK\_SETUP

#### **CSTA\_LINK\_SETUP Request**

CSTA\_ESC\_LINK\_SETUP is a starting message for ACD Server interworking. SCM checks the Application Code in CSTA\_ESC\_LINK\_SETUP to confirm the license according to CSTA application type.

#### **CSTA\_LINK\_SETUP Response**

This is a response message for the CSTA\_ESC\_LINK\_SETUP. The message includes User Group and User (line) information which can be ignored according to a CTI application.

### 2.2.2 CSTA\_ACD\_SETUP\_COMPLETE

#### **CSTA\_ACD\_SETUP\_COMPLETE Request**

CSTA\_ACD\_SETUP message informs the SCM of completion of the ACD server interworking flows. In the case of ACD server interworking, the SCM changes the AC

D mode to CTI server from System Auto.

### **CSTA\_ACD\_SETUP\_COMPLETE Response**

The response returns the result of the request.

## **2.2.3 CSTA\_ACD\_QUEUED\_INFO**

### **CSTA\_ACD\_QUEUED\_INFO Request**

CSTA\_ACD\_AGENT\_GROUP message requests information of ACD group list which an ACD agent is assigned to.

### **CSTA Queued Event (Call Event)**

CSTA\_QUEUED\_EVENT message delivers information of queuing calls.

## **2.2.4 CSTA\_LINK\_ALIVE**

### **CSTA\_LINK\_ALIVE Request**

CSTA\_ESC\_LINK\_ALIVE message is used for CTI link management.

The CTI application has to send this message periodically to notify that the link is available. The transmission period depends on the CTI application. SCM destroys the link if the last receive time is more than 30 seconds ago.

Refer to 1.2.3 CSTA Link Management.

### **CSTA\_LINK\_ALIVE Response**

This is a response message for the CSTA\_ESC\_LINK\_ALIVE.

The message includes the system name of the active SCM, which is changed when SCM switched over. With the system name the CTI application can know whether the switch-over occurs or not.

## **2.2.5 CSTA\_HUNT\_GROUP**

### **CSTA\_HUNT\_GROUP Request**

CSTA\_HUNT\_GROUP message requests information of a hunt group or all hunt groups.

### **CSTA\_HUNT\_GROUP Response**

The response message returns information of a hunt group or groups. This includes group name, hunt type, and hunt member list.

## **2.2.6 CSTA\_ACD\_GROUP**

### **CSTA\_ACD\_GROUP Request**

CSTA\_ACD\_GROUP message requests information of all ACD groups.

### **CSTA\_ACD\_GROUP Response**

The response message returns information of all ACD groups. This includes maximum queuing count, maximum overflow count, agent select method, wrap-up time, and destination according to the situation.

Refer to the structure of CSTA\_ACD\_GROUP Response.

## **2.2.7 CSTA\_ACD\_AGENT**

### **CSTA\_ACD\_AGENT Request**

CSTA\_ACD\_AGENT message requests information of all ACD agents.

### **CSTA\_ACD\_AGENT Response**

The response returns information of all ACD agents. This includes agent name, extension number, and agent status.

## **2.2.8 CSTA\_ACD\_AGENT\_GROUP**

### **CSTA\_ACD\_AGENT\_GROUP Request**

CSTA\_ACD\_AGENT\_GROUP message requests information of ACD group list which an ACD agent is assigned to.

### **CSTA\_ACD\_AGENT\_GROUP Response**

The response returns ACD group list which the ACD agent is assigned to.

## 2.3 Message Structure

This section describes the structure of the request and response messages.

### 2.3.1 Request Message Structure (Escape)

The SCM uses escape messages for the request messages.

```

CSTA-escape-service
{iso( 1) identified-organization( 3) icd-ecma( 12)
    standard( 0) csta2( 218) escape-service( 91) }

    CHOICE
    {extensions         CSTACommonArguments,
    noData              NULL}

END - of CSTA-escape-service

```

The structure of the escape message is as follows.

Sub-Field	Data Length	Description
Message ID	2 Bytes	The upper 1 byte has a Message ID value and the lower 1 byte is a reserved field and always filled with 0x00. Refer to 2.4.1 Message ID for each Message ID value.
Data Length	2 Bytes	Its byte order is big-endian. 2 byte Data Length Example: 0x00 0x02
Data	Up to 512 Bytes	This field is a data for the Message ID. Data field can divide to several sub fields according to Message ID. The maximum size of Data is 512 byte.

The following description is limited to a private Data format of the Escape message .  
Refer to 2.4 Common Message Field Definition for some fields.

### CSTA\_LINK\_SETUP Request

Table 2.1 CSTA\_LINK\_SETUP Request

Field		Length
Message ID		2 Byte
Data Length		2 Byte
Data	Application Code	1 Byte
	Additional Info	1 Byte

- Application Code: According to the purpose of CSTA application, different application code is used. SCM checks a license with the application code. Refer to 2.4 Common Message Field Definition for Application Code value.
- Additional Info: SCM determines whether the user number plan is included in the CSTA\_LINK\_SETUP Response or not by this field.

Additional Info	Value	Description
Added	0x00	The user number plan is included in the response message.
Node	0x01	The user number plan is not included in the response message

Data Length		2 Byte
Data	Agent ID	16 Byte

- Agent ID: Specifies an Agent ID to get an ACD group list which the ACD agent is assigned to.

### 2.3.2 Response Message Structure (Private Event)

The SCM uses private events for the response message.

```

CSTA-escape-service
{iso( 1) identified-organization( 3) icd-ecma( 12)
    standard( 0) csta2( 218) escape-service( 91) }
DEFINITION::=
BEGIN

PrivateEvent ::= NULL          --      The actual encoding of the
private event is added here.
                                --      replacing NULL with another valid ASN.1
                                type.

END - of CSTA-escape-service
    
```

The structure of the private event is as follows.

Sub-Field	Data Length	Description
Message ID	2 Bytes	The upper 1 byte is Message ID and the lower 1 byte is reserved as 0x00. Refer to 2.4 for Message IDs
Data Length	2 Bytes	Length of date. Byte order is big endian. (ex) date length of 2 byte date: 0x00 0x02
Data	Up to 512 Bytes	Date for the Message ID. Maximum data size is 512 bytes.

	Data Block	User Number	20 Byte
		Reserved	1 Byte
		User Registration Status	1 Byte
		User Name	40 Byte
		User Group	2 Byte
Reserved	2 Byte		

- Total Block Count: The total number of fragmented messages. The user information can be divided and delivered in several response messages.
- Current Block Count: The current number of fragmented messages when the several response messages are sent.
- Data Block Count: The number of user information in a response message. The Maximum user data count is 50 in a response message.
- User Number: An extension number of a user.
- User Registration Status: A Registration status of a user.
- User Name: A name of a user.
- User Group: a user group which is assigned to a user.
- Reserved: Not used.

	System Name	32 Byte
	Master IP Address	40 Byte
	Slave IP Address	40 Byte

- Application Code: According to the purpose of CSTA application, different application code is used. This field has same value with the Application Code in the request message. Refer to 2.4 Common Message Field Definition for Application Code value.
- Reserved: Not used.
- System Name: The system name of currently active SCM. If SCM is switched over, the system name of newly active SCM is delivered when SCM is configured Active-Standby mode.
- Master IP Address: When SCM is deployed in Active-Active configuration, an IP address of Master node is delivered.
- Slave IP Address: When SCM is deployed in Active-Active configuration, an IP address of Slave node is delivered.

Field		Length
Data	Total Block Count	2 Byte
	Current Block Number	2 Byte
	Block Member Count	2 Byte
	Hunt Member Number	20 Byte * 50

- Sequence: Shows how many hunt group information are sent and whether the transmission ends or not.

Sequence	Value	Description
Single Sequence	0xFFFF	A specified hunt group is delivered.
Multi Sequence	0x0001~0xN	Current sequence when multiple hunt group information is delivered in the several response messages
End Sequence	0x00000	Means all information is delivered and the transmission is complete.

- Hunt Group Number: The number of Hunt group.
- Hunt Type: How to hunt a member of the group.

Hunt Type	Value	Description
Sequential	0x01	The call is always directed to the first member in the hunt group in regular sequence.
Circular	0x02	The call is directed to the member on the hunt group list after the one who answered the previous call.
Parallel	0x03	The call is directed to all members in the hunt group.
Random	0x04	The call is randomly directed to one member in the hunt group.

- Total Block Count: The total number of fragmented messages. The information of a hunt group can be divided and delivered in several response messages.
- Current Block Count: The current number of fragmented messages when the several response messages are sent.
- Block Member Count: The number of member included in the response message.
- Hunt Member Number: The member list of a hunt group. The maximum number is 50 in a response message.

- Sequence: Shows how many ACD group information are sent and whether the transmission ends or not.

Sequence	Value	Description
Single Sequence	0xFFFF	A specified ACD group is delivered.
Multi Sequence	0x0001~0xN	Current sequence when multiple ACD group information is delivered in the several response messages
End Sequence	0x00000	Means all information is delivered and the transmission is complete.

- ACD Group Number: The number of ACD group.
- ACD Group Name: The name of ACD group.
- Agent Select Method: How to select an agent for call distribution.

Sequence	Value	Description
Longest Idle Agent	0x00	When distributing an ACD group call to an agent, the call is delivered to the agent with the longest idle time.
Least Occupied Agent	0x01	When distributing an ACD group call to an agent, the call is delivered to the agent with the fewest calls since the agent logged in.
Sequence Mode	0x02	Calls are distributed to the ACD group's agents in a sequence.

- **Maximum Queuing Count:** Specifies the maximum number of calls allowed to wait for the ACD.
- **Maximum Overflow Count:** Specifies the maximum number of calls allowed to be forwarded when forwarding an incoming ACD group call to another phone number, if the phone number is an ACD group number.
- **Agent No answer Time (sec):** Specifies the No Answer time to wait until the agent answers the call. If the agent is not answered by the time, the call is distributed to another agent.
- **Normal Wrap-Up Time:** Specifies the time to wrap up after the agent ends the ACD call.
- **No Answer Wrap-Up Time:** Specifies the time not to connect an agent which is not answered to the ACD call during No Answer Time.
- **Overflow Time:** Specifies the time to forward the call to another destination when there is no available agent or no answer for the queued call.
- **Overflow Destination:** Specifies the next destination which the queued call is forwarded to when there is no available agent or no answer for the queued call.
- **All Busy Destination:** The next destination which the queued call is forwarded to when all agents are on busy.
- **All Logout Destination:** The next destination which the queued call is forwarded to when all agents are logged out.
- **Total Block Count:** The total number of fragmented messages. The ACD group information can be divided and delivered in several response messages.
- **Current Block Count:** The current number of fragmented messages when the several response messages are sent.
- **Block Member Count:** The number of member included in the response message.
- **ACD Member Number:** The member list of an ACD group. The maximum number is 50 in a response message.

## 2.4 Common Message Field Definition

### 2.4.1 Message ID

Msg ID		Message Name	Description
Type	RQ RS		
0x01	0x00	Link Setup	Specifies the Application Type which is used for license check. In the response message can include user information of SCM according to an option.
	0x01		
0x02	0x00	Link Alive	Specifies to check link status periodically.
	0x01		
0x04	0x00	Hunt Group Info	Specifies the information of hunt group.
	0x01		
0x07	0x00	ACD Group Info	Specifies the list of all ACD Group.
	0x01		
0x08	0x00	ACD Agent ID Info	Specifies the list of all agents.
	0x01		
0x0D	0x00	ACD Setup Complete	Specifies the completion of setup.
	0x01		
0x0E	0x00	ACD Agent Group List	Specifies the list of ACD group which an agent is assigned to.
	0x01		

### 2.4.2 Application Code

Application Code	Value	Description
Other CSTA Application	0x00	CSTA Applications which use CSTA for some purpose.
ACD Server	0x20	CTI application which is used to interwork with the SCM as an ACD server.

### 2.4.3 Tel Number Option

Tel Number Option	Value	Description
All	0x00	Do not specify a tel number, which means all numbers.
Specific Tel Number	0x01	Specify a tel number.

## 2.4.4 ACD Mode

ACD Mode	Value	Description
System Auto	0x00	ACD is controlled by SCM internal process.
CTI Server	0x01	CTI Server is in charge of ACD control.

## 2.4.5 Agent Status

Agent Status	Value	Description
AgentNotReady	0x00	Login but not ready
AgentNull	0x01	Logout
AgentReady	0x02	Login and ready.
AgentBusy	0x03	Connected to a call.
AgentWorkingAfterCall	0x04	Working after call.

# CHAPTER 3. Samsung CSTA Phase-II PICS

---

## 3.1 Introduction

The Protocol Implementation Conformance Statement (PICS) is a statement of which capabilities and options of the protocol have been implemented. The PICS can have a number of uses, including use:

- by the protocol implementor, as a check-list to reduce the risk of failure to conform to the standard through oversight;
- by the supplier and acquirer (or potential acquirer) of the implementation, as a detailed indication of the capabilities of the implementation, stated relative to the common basis for understanding provided by the standard PICS proforma;
- by the user (or potential user) of the implementation, as a basis for initially checking the possibility of interworking with another implementation (note that, while interworking cannot be guaranteed, failure to interwork can often be predicted from incompatible PICS);
- by a protocol tester, as the basis for selecting appropriate tests against which to assess the claim for conformance of the implementation.

## 3.2 Definition and abbreviations

This Standard uses the following terms defined in ISO 9646-1:

- Protocol Implementation Conformance Statement (PICS);
- PICS Proforma.

In the 'Reference' columns of the body of the PICS proforma, the letter S refers to the CSTA Phase II Services Standard ECMA-217 and the letter P refers to the CS TA Phase II Protocol Standard ECMA-218.

The following terms are used in the 'Status' columns of the body of the PICS proforma:

m	mandatory; the capability is required for conformance to the protocol.
o	optional; the capability is not required for conformance to the protocol, or is required only within constraints described in dependencies ('if' statements). If the capability is implemented, it is required to conform to the protocol specifications.
o.<n>	optional, but support of at least one of the group of options labelled by the same numeral <n> is required.
C.<cid>	conditional; the requirement is conditional according to the condition identified by <cid>.
<item>	simple-predicate condition, dependent on the support marked for <item>.

### 3.3 Conformance

The supplier of a protocol implementation which is claimed to conform to ECMA-218 shall complete a copy of the Protocol Implementation Conformance Statement (PICS) proforma in clauses A.5 to A.13.

### 3.4 Instructions for completing the PICS proforma

The first part of the PICS proforma, the Implementation Identification (clause A.5), is to be completed as indicated with the information necessary to identify fully both the supplier and the implementation. The main part of the PICS proforma (clauses A.6 to A.13) is a fixed format questionnaire divided into subclauses each containing a group of individual items. Answers to the questionnaire items are to be provided in the rightmost column, either by marking an answer to indicate a restricted choice (usually Yes or No), or by checking off all supported values (for parameters with a default).

Each item is identified by an item reference in the first column; the second column title indicates the nature of the table items which follow. The third column contains the references to material that specifies the item in the main body of ECMA-217 and ECMA-218. The remaining columns record the status of the item-whether support is mandatory, optional, or not applicable-and provide space for the answers. Where a service is not supported, any parameters or dependent service components are not applicable. These dependencies are indicated in the status column using the item identifier as a key. It is not necessary to complete items in any subsidiary sections if a 'No' response is given to the primary service component. For supported services, a negative response to a mandatory subsidiary item indicates that the service does not conform to ECMA-218, and conformance cannot be claimed for that service.

Figure 3.1 below is offered as an informative clarifying example of the first of the PICS proforma tables, that given in A.6.1 for the Alternate call service.

Item	Service/Feature	Reference	Status	N/A	Supported?
A1	Alternate call service	S10.1 P 9.1	o		Yes [ ] No [ ]
A1a	Active call	P 18.6	A1: o1		Yes [ ] No [ ]
A1b	Hold call	P 18.6	A1: o1		Yes [ ] No [ ]
A1c	Private data in request	P 18.8	A1: o		Yes [ ] No [ ]
A1d	Security data in request	P 18.7	A1: o		Yes [ ] No [ ]

Identifies this service/feature and all its parameters

Reference to ECMA-218, CSTA Protocol, where item is first seen

Reference to ECMA-217, CSTA Services

Support of individual CSTA services/features is 'optional'

Tick to indicate that this service/feature is supported

Tick to indicate not supported

Items are linked (part of link '1'). At least one must be supported

Support for this item is 'mandatory' for the service

Part of ...

A mandatory item would be Not Applicable if the item containing it (in this case the service) was not supported

Figure 3.1 Clarifying diagram (informative)

## 3.5 Implementation identification

Supplier	-
Protocol Version	First Edition
Date of Statement	-
Contact point for queries about the PICS	-
Implementation Name(s) and Version(s)	-
Other information necessary for full identification - e.g. Name(s) and Version(s) for machines and/or operating systems; system name(s)	-

The first five items are required for all implementations; other information may be completed as appropriate in meeting the requirement for full identification.

The terms Name and Version should be interpreted appropriately to correspond with a supplier's terminology (e.g. Type, Series, Model).

- If application user can notify the stuck call, the user can use SnapShotDevice command, then the stuck call can be synchronized with system's call state.
- If application user can not notify the stuck call, the stuck call will be remained. For preventing the stuck call, automatic synchronization method is needed.

SCM system is recommend the method that application send the SnapShotDevice command per defined time.

The period time of sending SnapShotDevice command must be able to change, and recommend minimum 10 minutes.
